

## Berekenbaarheid 2006, Uitwerking toets 3

1.

$$f_1 = \text{pred}$$

$$f_2 = s$$

$$(f_1 \circ f_2)(x) = f_1(f_2(x)) = \text{pred}(s(x)) = (x+1) \dot{-} 1 = x, \text{ dus } f_1 \circ f_2 = \text{id}.$$

2.

$$\text{tower}(0) = 1 = g()$$

$$\text{tower}(y+1) = 2^{\text{tower}(y)} = h(y, \text{tower}(y))$$

$$g() = 1$$

$$h(y, w) = 2^w$$

$$g = c_1^{(0)}$$

$$h = \text{exp} \circ (c_2^{(2)}, p_2^{(2)})$$

$$\text{tower} = \text{primrec}(g, h) = \text{primrec}(c_1^{(0)}, \text{exp} \circ (c_2^{(2)}, p_2^{(2)}))$$

3.

$$f(n) = \mu m. \prod_{i=m}^{m+n-1} \text{cosg}(\text{prime}(i))$$

(Met deze definitie hebben we  $f(0) = 0$ , wat redelijk lijkt.)
