# the Mizar type system

Freek Wiedijk Radboud University Nijmegen

TPHOLs 2007

University of Kaiserslautern

2007 09 12, 10:00

### this talk

- Mizar
- Mizar types
- the paper
  - the Mizar type system in the form of typing rules
  - correctness with respect to first order predicate logic

#### Mizar versus the HOLs

Mizar

HOL

**Isabelle** 

**PVS** 

Coq

.

batch checking

first order logic

readable proofs

untyped set theory

very nice type system

interactive

higher order logic

tactic scripts

typed foundations

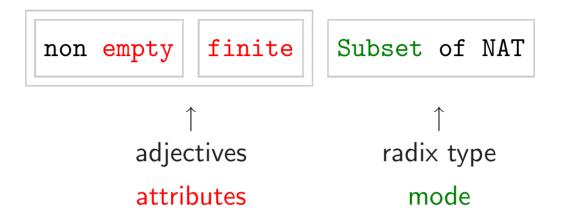

#### Mizar types

#### features

- dependent types
- subtyping
- 'attributes'
- structure types (records)

Alternative Aggregates in Mizar Gilbert Lee and Piotr Rudnicki MKM 2007, LNAI 4573

#### attributes

### overloading

meaning of an attribute depends on the radix type:

- connected Relation
- connected Graph
- connected TopSpace

#### example

```
definition let d be | non zero Element of NAT |;
 func cyclotomic_poly d -> | Polynomial of F_Complex
                                                        means
   ex s being | non empty finite Subset of F_Complex
    st s = { y where y is | Element of MultGroup F_Complex | : ord y = d } &
       it = poly_with_roots((s,1)-bag);
end;
                   Primitive Roots of Unity and Cyclotomic Polynomials
       UNIROOTS
                   Broderick Arneson and Piotr Rudnicki
                   3293 lines, 135K
 full Mizar library 985 'articles', 1.97 million lines, 68.9M
```

```
for i being Integer holds i >= 0 iff i is Nat \forall i: \mathbb{Z}.\ i \geq 0 \Leftrightarrow (i:\mathbb{N}) i is Nat \neq i in NAT \uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow \qquad type \qquad term 'has type' 'is element of' the type system the set theory
```

'coerce' a term to a more informative type by giving a proof

```
then n' - n >= 0 by XREAL_1:50;
then reconsider d = n' - n as Nat by INT_1:16;
...
```

## subtyping

```
definition let C be Category;
 mode Subcategory of C -> Category means
:: CAT_2:def 4
end;
                              set
                            Category
                       Subcategory of C
```

supertype may depend on the types of the arguments of the type

#### clusters

any term with attribute empty automatically also gets attribute finite

### typed or untyped logic?

#### what does it all mean?

foundations of Mizar:

Tarski-Grothendieck set theory

\_

ZFC + 'there are arbitrarily large inaccessible cardinals'

set of axioms on top of untyped first order predicate logic

#### the axioms of Mizar

```
X \subseteq Y \Leftrightarrow (\forall x. \ x \in X \Rightarrow x \in Y)
TARSKI:def 3
TARSKI:def 5
                                                                                                                                                                                                                                                                                                                                                    \langle x, y \rangle = \{ \{x, y\}, \{x\} \}
                                                                                                                                                                                         X \sim Y \Leftrightarrow \exists Z. X \subseteq M \Rightarrow X \sim M \lor X \in M)
```

#### translation to untyped logic

for i being Integer holds i >= 0 iff i is Nat 
$$\forall\,i: \texttt{Integer}\,.\,\,i\geq 0 \,\Leftrightarrow\, (\,i:\texttt{Nat}\,)$$
 
$$\downarrow$$
 
$$\forall\,i\,.\,\, \texttt{Integer}\,(i) \Rightarrow \big\lceil\,i\geq 0 \,\Leftrightarrow\, \texttt{Nat}\,(i)\,\big\rceil$$

types are just predicates that the system manages automatically

dependent types with n arguments are predicates with n+1 arguments

## the type system as typing rules

## symbolic notation

$x \ f \ M \ lpha$			term variables function symbols mode symbols attribute symbols
$R \\ a$	::=	$x \mid f(\vec{t})$ $\star \mid M(\vec{t})$ $\alpha \mid \bar{\alpha}$ $\vec{a} R$	terms radix types adjectives types
$D \ \Delta$		$\overline{[\Delta](J)}$	judgment elements declarations
		$\Gamma; \Delta \vdash J$	judgments

#### rules

## twenty-two typing rules

three examples:

$$\overline{\;\;;\;\vdash\cdot\;\;}$$

mode definition:

$$\frac{\Gamma;\,\vec{x}:\vec{T}\vdash\exists\,T'}{\Gamma,\,[\vec{x}:\vec{T}](M(\vec{x})\leq T'),\,[\vec{x}:\vec{T}](\exists\,M(\vec{x}));\vdash\cdot}\,\,M\not\in\Gamma$$

conditional cluster:

$$\frac{\Gamma; \Delta \vdash \vec{a} \, T' \leq T' \quad \Gamma; \Delta \vdash \vec{a}' \, T' \leq T'}{\Gamma, \, [\Delta](\vec{a} \, T' \leq \vec{a}' \, T'); \, \vdash \cdot}$$

#### correctness

### translating judgments

type judgment  $\rightarrow$  first order sequent

$$\mathsf{int} \leq \star, \ \exists \ \mathsf{int}, \ \mathsf{pos/int}, \ \exists \ \mathsf{pos} \ \mathsf{int} \ ; \ x : \mathsf{pos} \ \mathsf{int} \ \vdash \ x : \star \\ \rightarrow \\ (\forall x . \ \mathsf{int}(x) \Rightarrow \top) \, , \ (\exists x . \ \mathsf{int}(x)) \, , \ \top, \ (\exists x . \ \mathsf{pos}(x) \wedge \mathsf{int}(x)) \, , \ (\mathsf{pos}(x) \wedge \mathsf{int}(x)) \ \vdash \ \top$$

#### main theorem

'the type system is correct'

derivable judgment → provable sequent

#### outlook

#### system in the paper is an idealization

```
definition let n be Nat;  \mbox{redefine mode Element of } n \rightarrow \mbox{Element of } n+1; \\ \mbox{end}; \\ \mbox{according to the rules from the paper we have} \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \rightarrow \mbox{Element of } n+2 \rightarrow \dots \\ \mbox{in the actual Mizar system we just have} \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Element of } n+1 \\ \mbox{Element of } n \rightarrow \mbox{Ele
```

## why not have something like the Mizar type system yourself?

- the Mizar proof language is well-known to be nice
- the Mizar type system is less known, but very nice too
- every system can have the Mizar type system as a layer on top
