

Security of smart grid communication protocols

Erik Poll
Radboud University Nijmegen

C-DAX is funded by the European Union's Seventh Framework Programme (FP7-ICT-2011-8) under grant agreement n° 318708

Overview

- *Before* starting to secure communications...
- End-to-end security
 - limits of secure tunnels using eg. TLS
- Securing Information Centric Networking (ICN) in C-DAX

Before starting to secure communications...

- *Primary* goal of ICT is to provide functionality
- **Security** is about controlling the risks that this functionality brings.
This is always a *secondary concern*
People will typically choose functionality over security...
- So, before starting to securing communications:
Which functionality & data do you want to provide?
When, where and to whom?
Basis for deciding: a good **risk assessment**

Example 1: smart metering in the Netherlands

Original planned smart metering information architecture

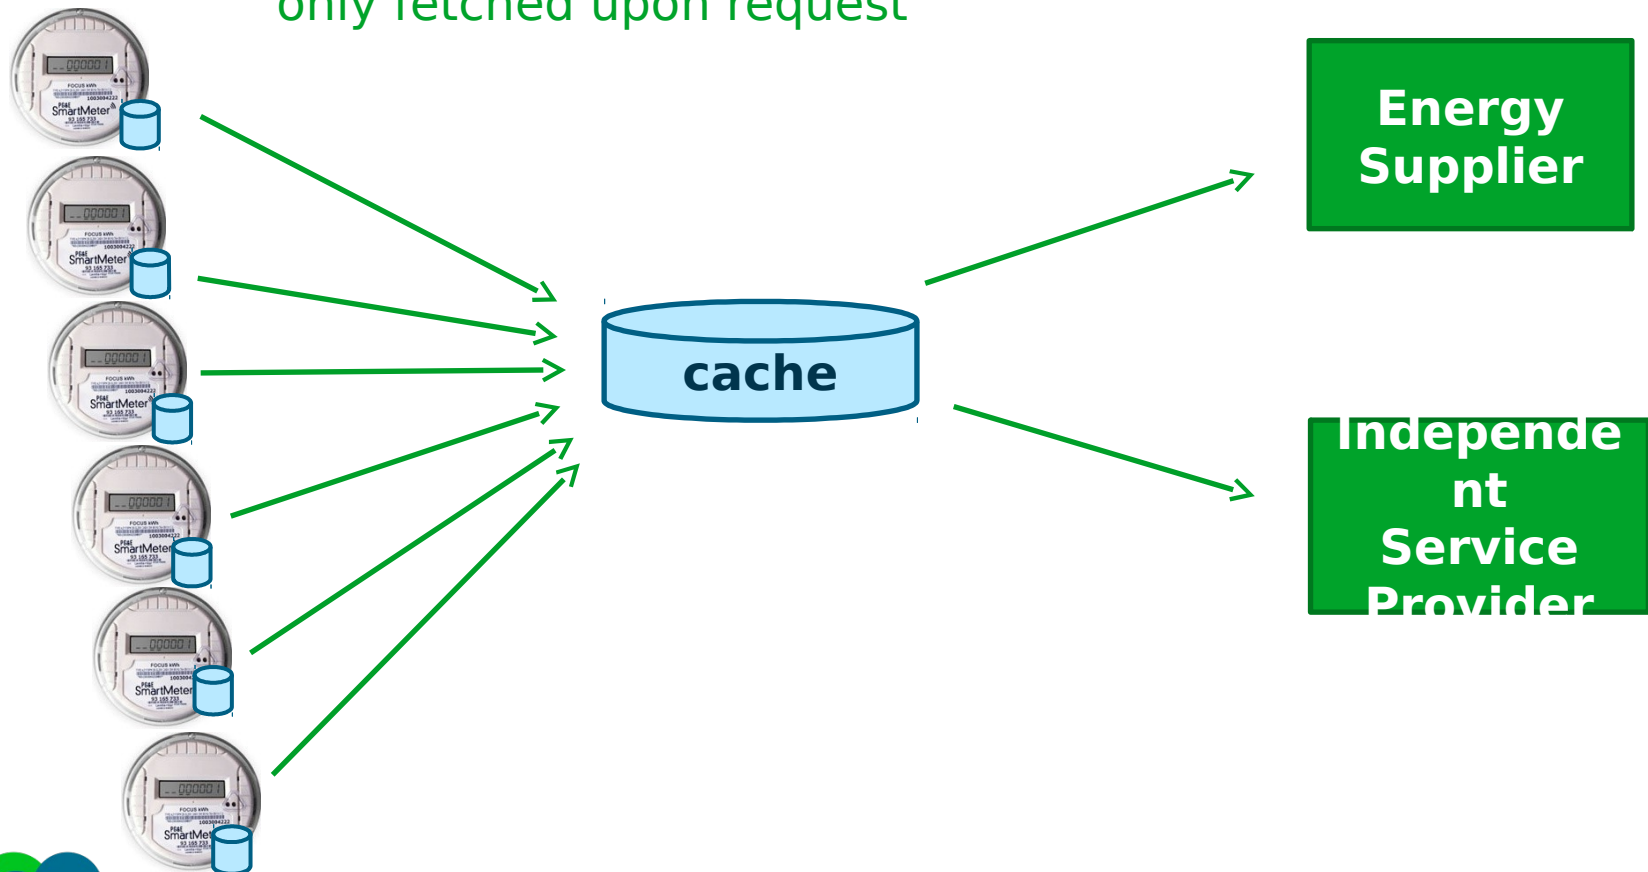

Detailed smart metering records held in central database

Example 1: smart metering in the Netherlands

Revised architecture due to privacy concerns

Detailed records kept in the meter itself,
only fetched upon request

Example 2: smart metering in the Netherlands

Smart meter can act as remote off switch

- restricting or stopping delivery

Does this convenient functionality outweigh the security concerns it brings?

After some discussion, smart meters in Netherlands now won't have this capability.

Rare example of a choice for security over functionality!

Example: Security as after-thought?

- Open Charge Point Protocol (OCPP) by Open Charge Alliance

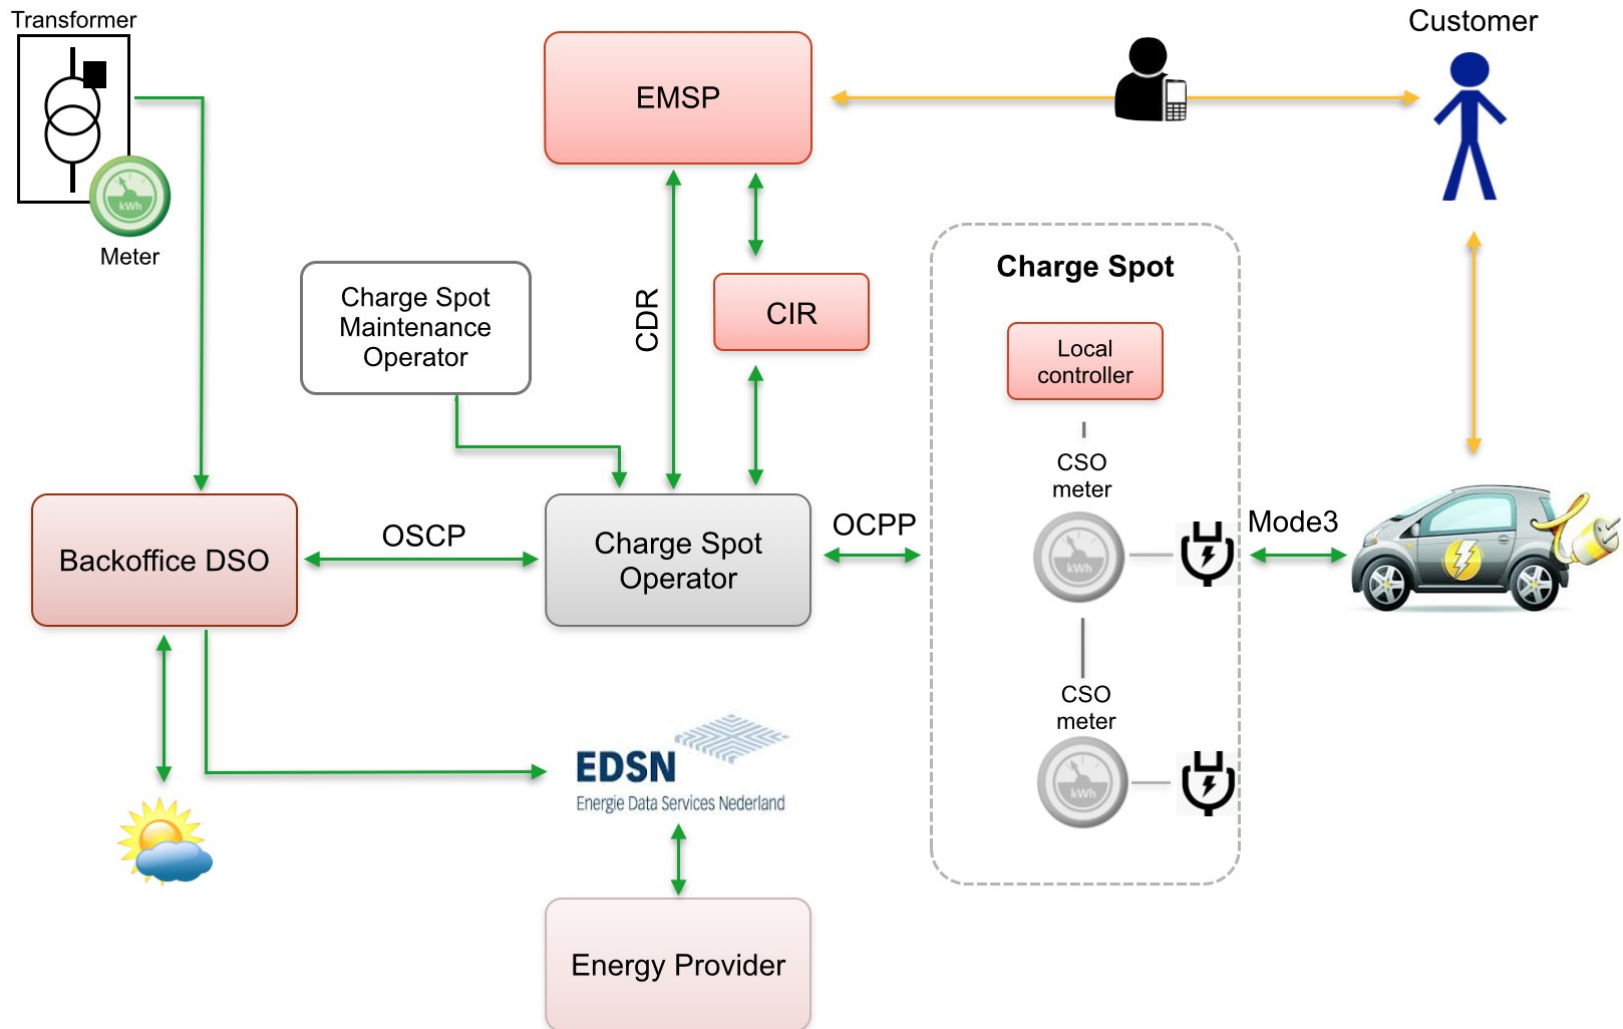

7. Security

To avoid exposure of private sensitive data, the transport of SOAP messages SHOULD be secured with SSL/TLS (e.g. HTTPS).

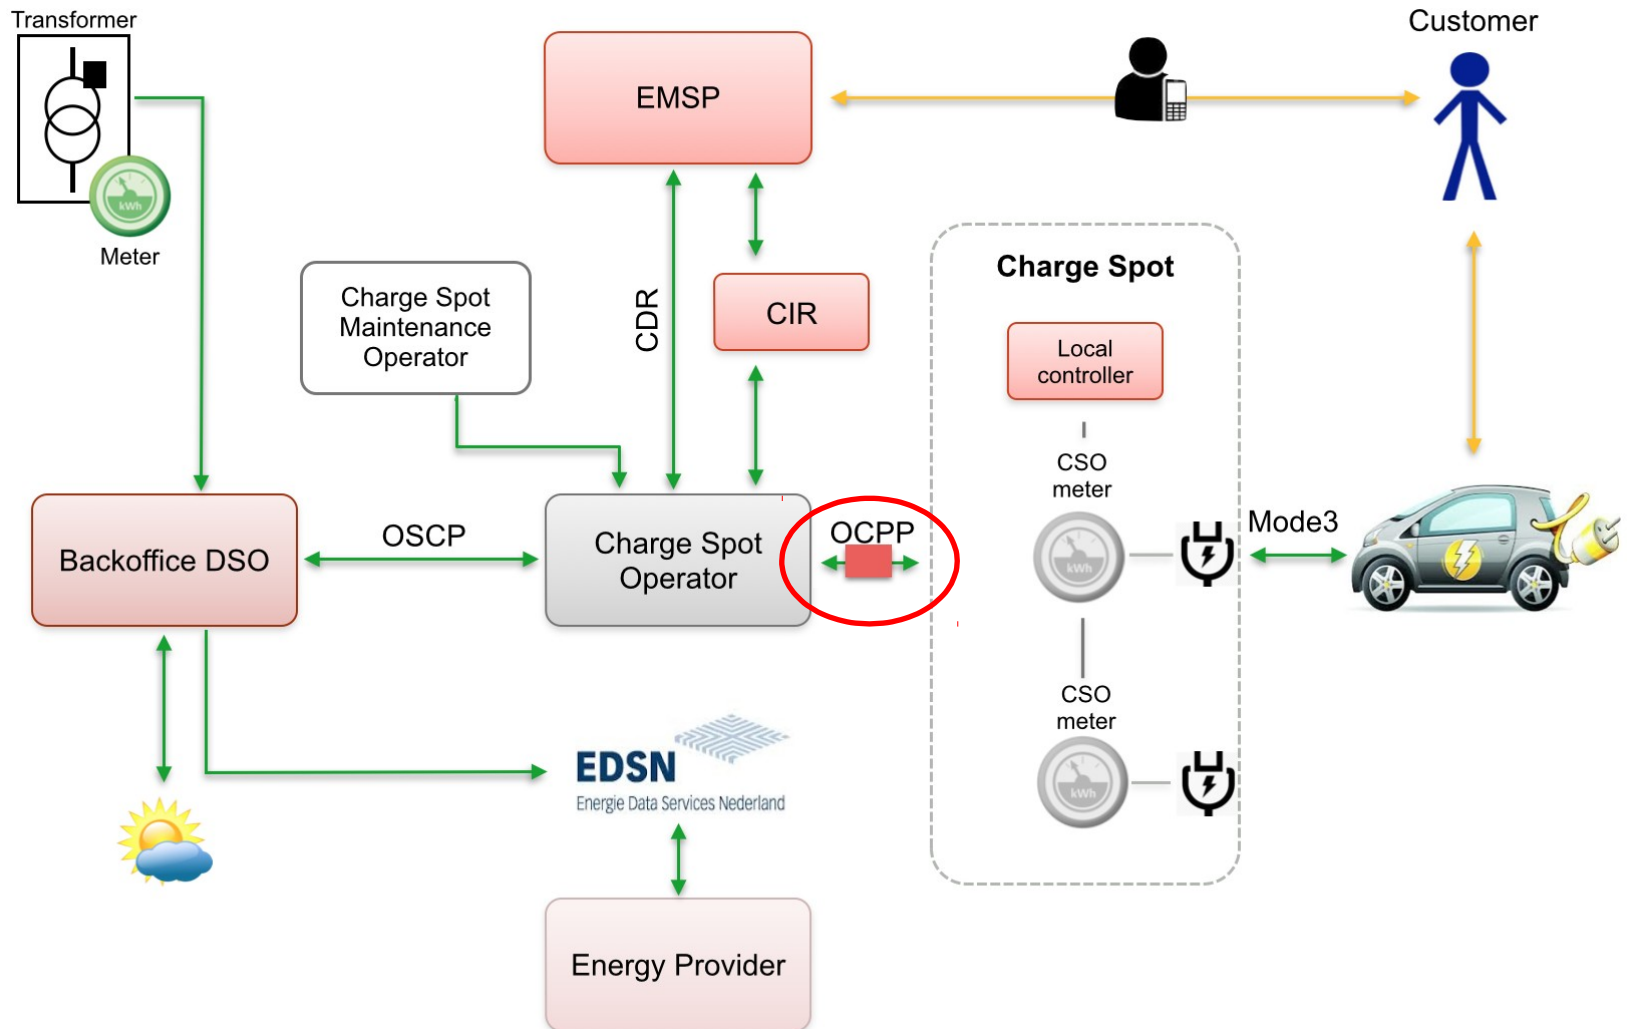

For a receiving party to trust a received message, the sending party SHOULD use a client certificate.

- NB “SHOULD” not “MUST”
 - This is the *only* mention of security, on the very last (200th!) page
- + using a standard security solution such as TLS is a good idea
- securing this link might not provide end-to-end security we want...

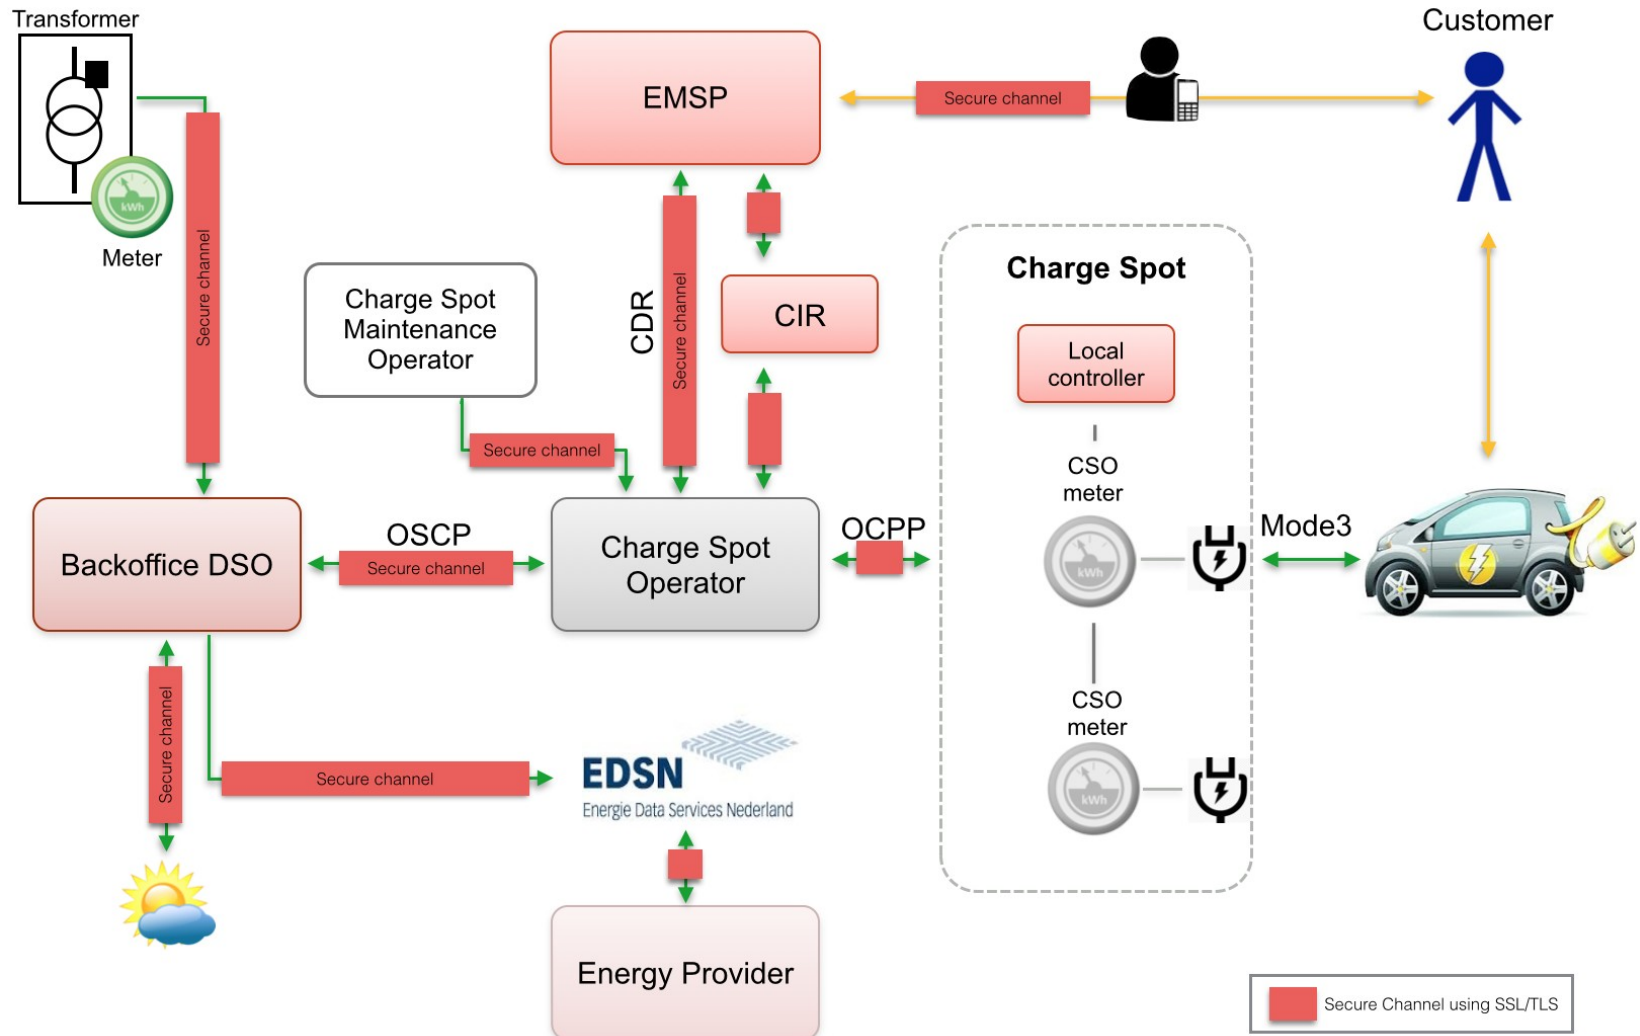

Possible architecture for smart EV charging

Possible architecture for smart EV charging

Possible architecture for smart EV charging

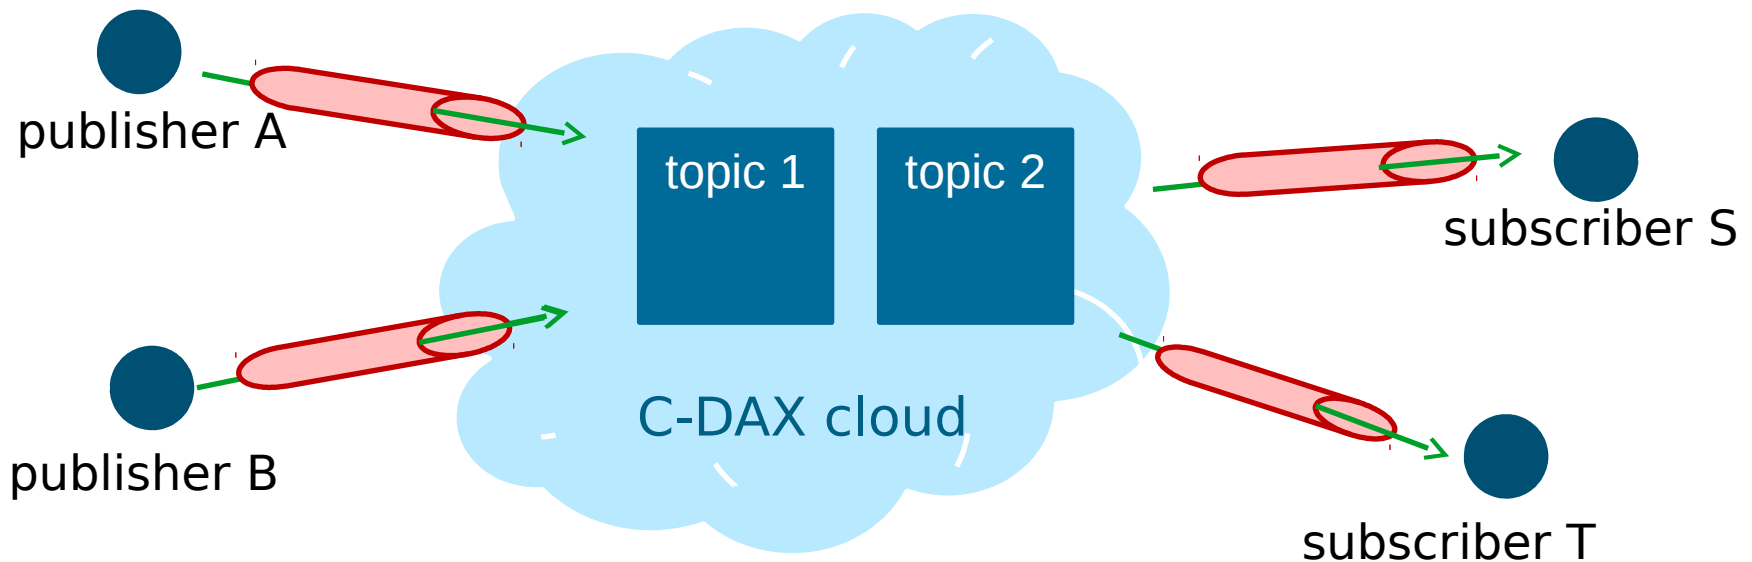

Limits of securing communication links

- Securing a communication link using standard solution like TLS is a great idea
 - + we don't have to trust the underlying infrastructure except for availability
 - + security is 'automatically' enforced
 - once data leaves the pipe, the security of the data is gone
 - it provides end-to-end security **for one link between two parties**
- link-by-link security will not provide end-to-end security over multiple links
 - we have to trust all intermediate parties

Securing Information Centric Networking (ICN)

One security benefit:
clients need not know each
other's IP address

Secure TLS tunnels won't
provide end-to-end
security
between publishers
and subscribers

Securing Information Centric Networking (ICN)

One security benefit:
clients need not know each
other's IP address

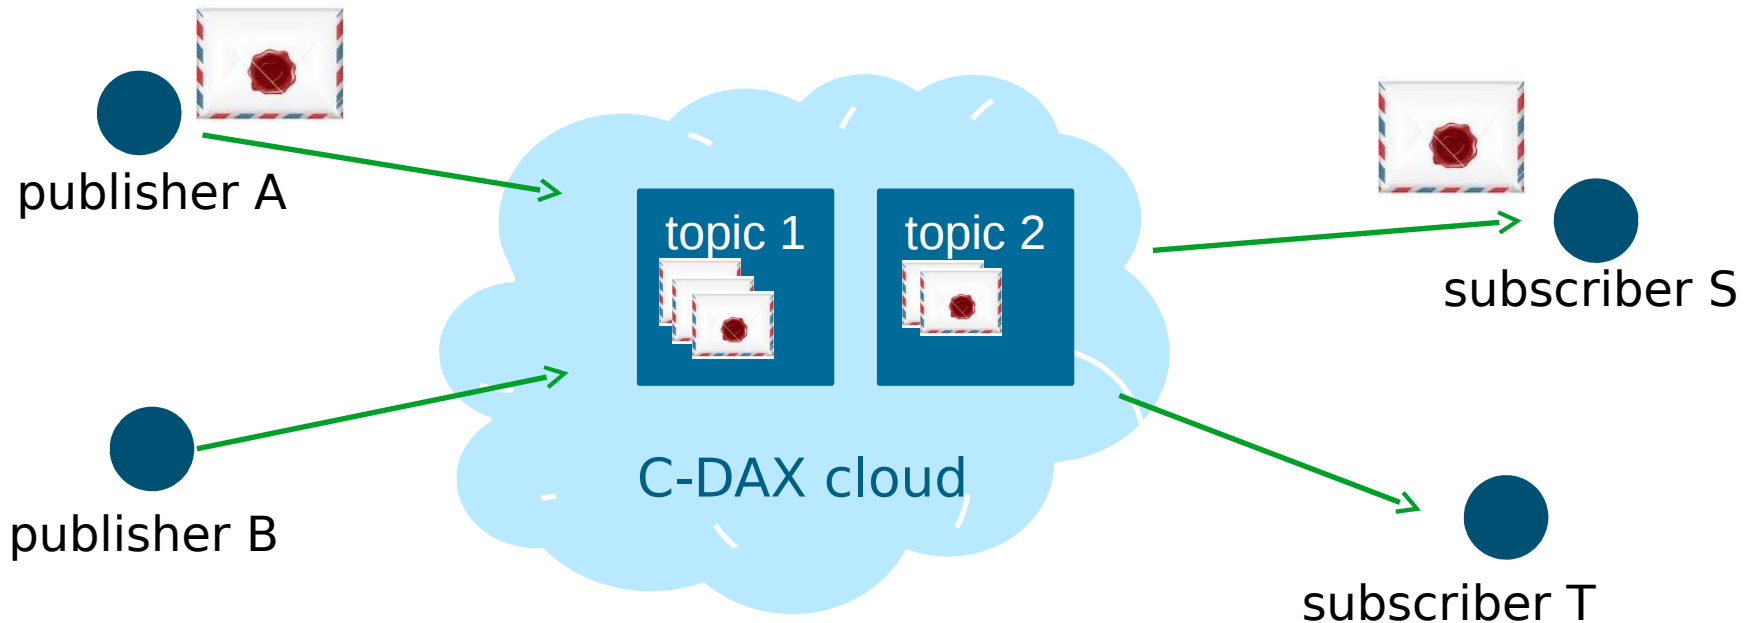

Secure TLS tunnels won't
provide end-to-end
security
between publishers
and subscribers

Securing Information Centric Networking (ICN)

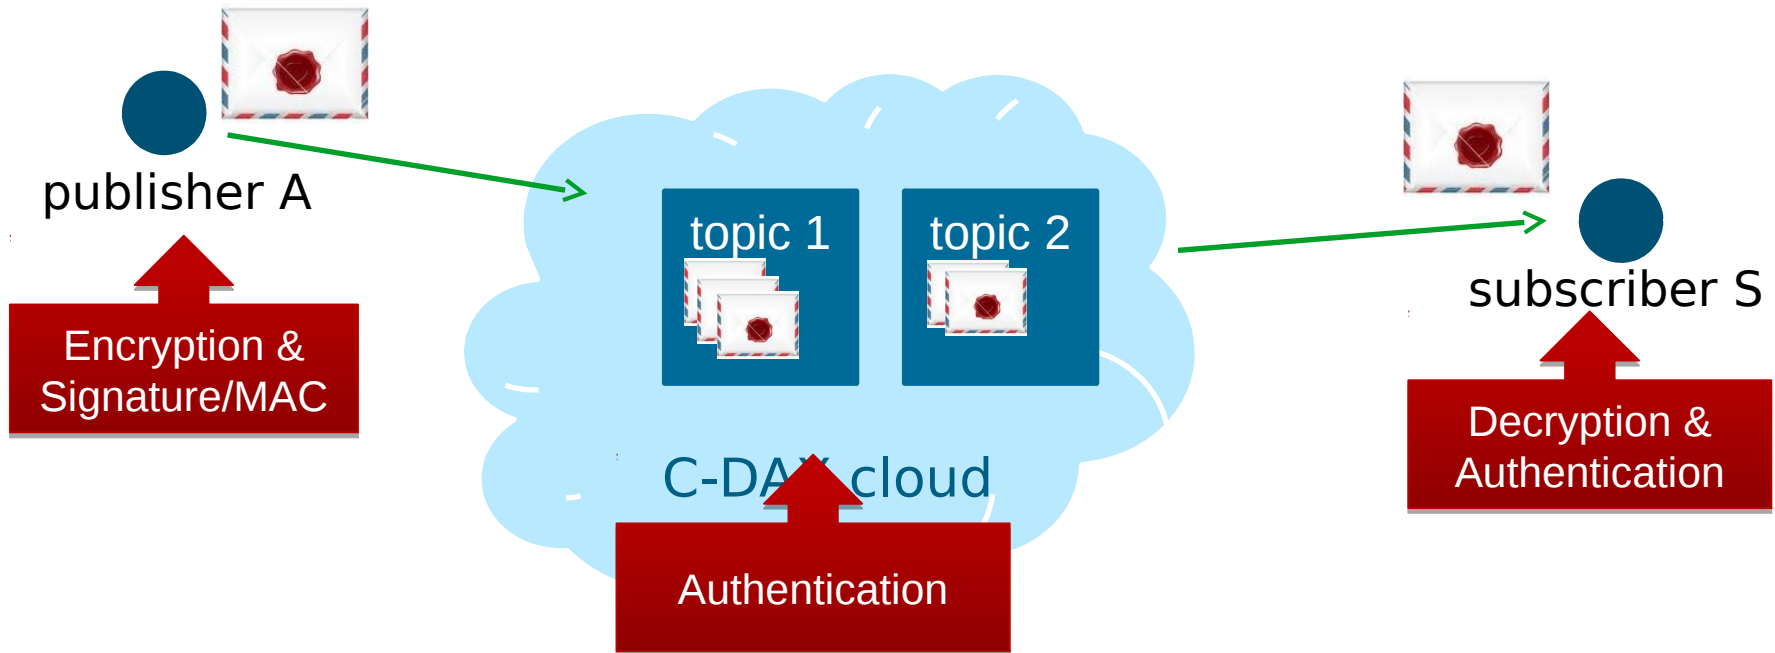

We have to secure the data itself

- Conceptually: data in sealed closed envelope
 - seal gives **authenticity/integrity** - using **digital signature** or **MAC**
 - closed envelope gives **confidentiality** - using **encryption**

Securing Information Centric Networking (ICN)

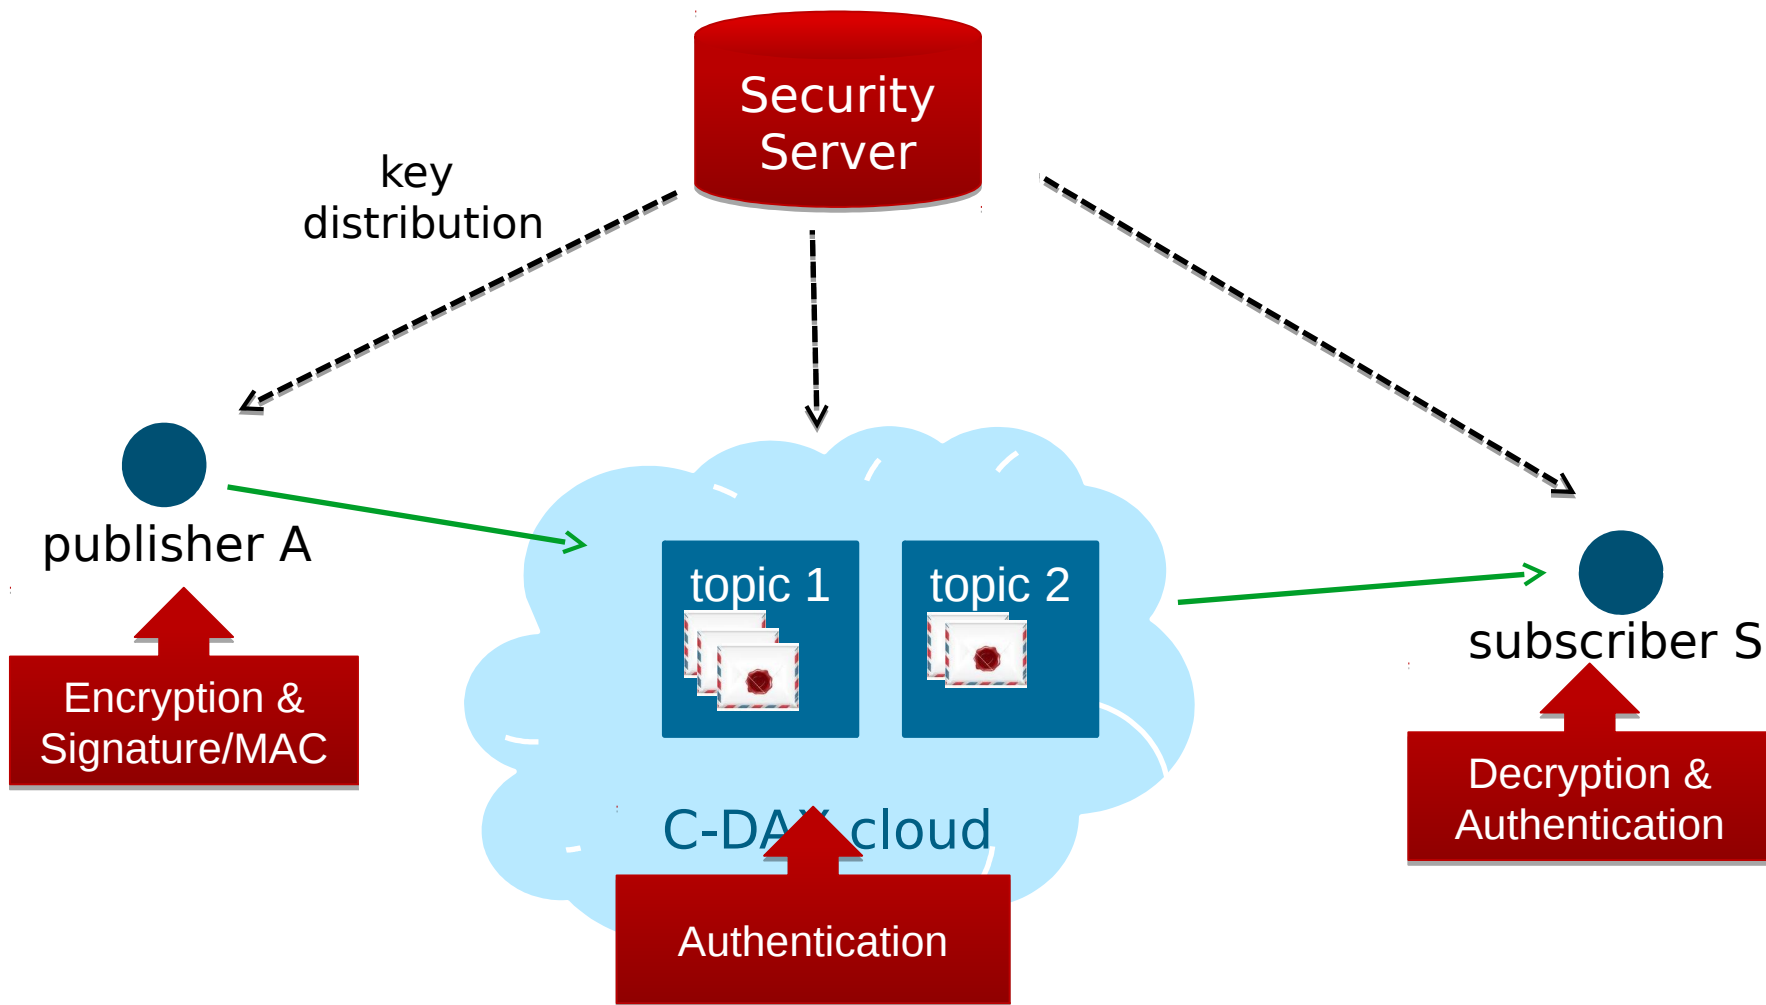

NB no need to trust the C-DAX cloud at all

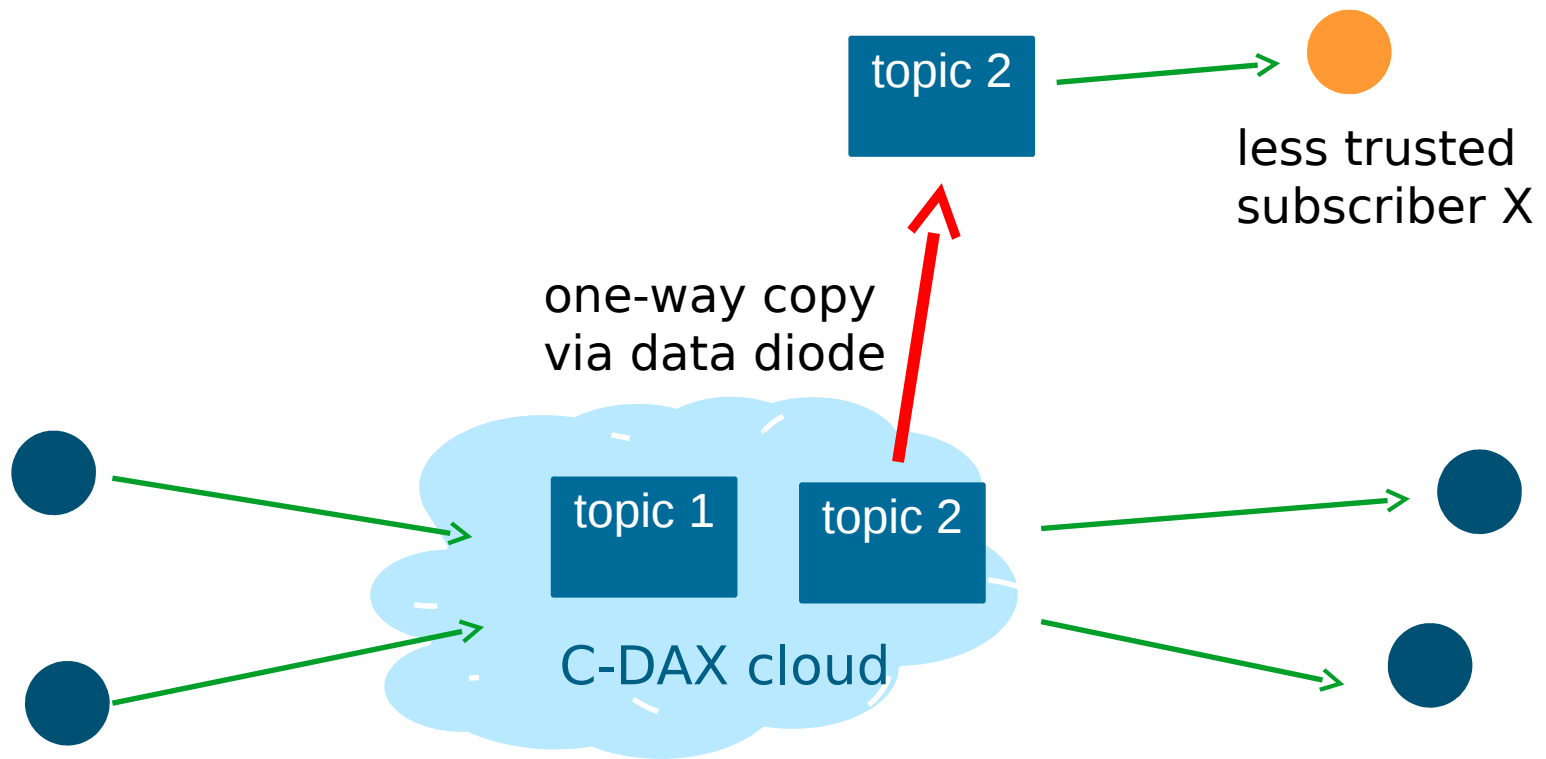

Crypto scheme & key distribution

- Choice in cryptographic scheme & key distribution.
 - Eg.
 - Long lived public/private keypair **per client** for authentication (like normal PKI)
 - Symmetric keys **per topic**
 - different keys for authentication and encryption, so that cloud can authenticate but not eavesdrop
- Choice in which information to reveal on outside of envelope
 - eg to allow filtering, though limited forms of filtering of encrypted data are possible
- We do need to include time stamps or sequence numbers to guarantee order & freshness
 - which we get for free with TLS

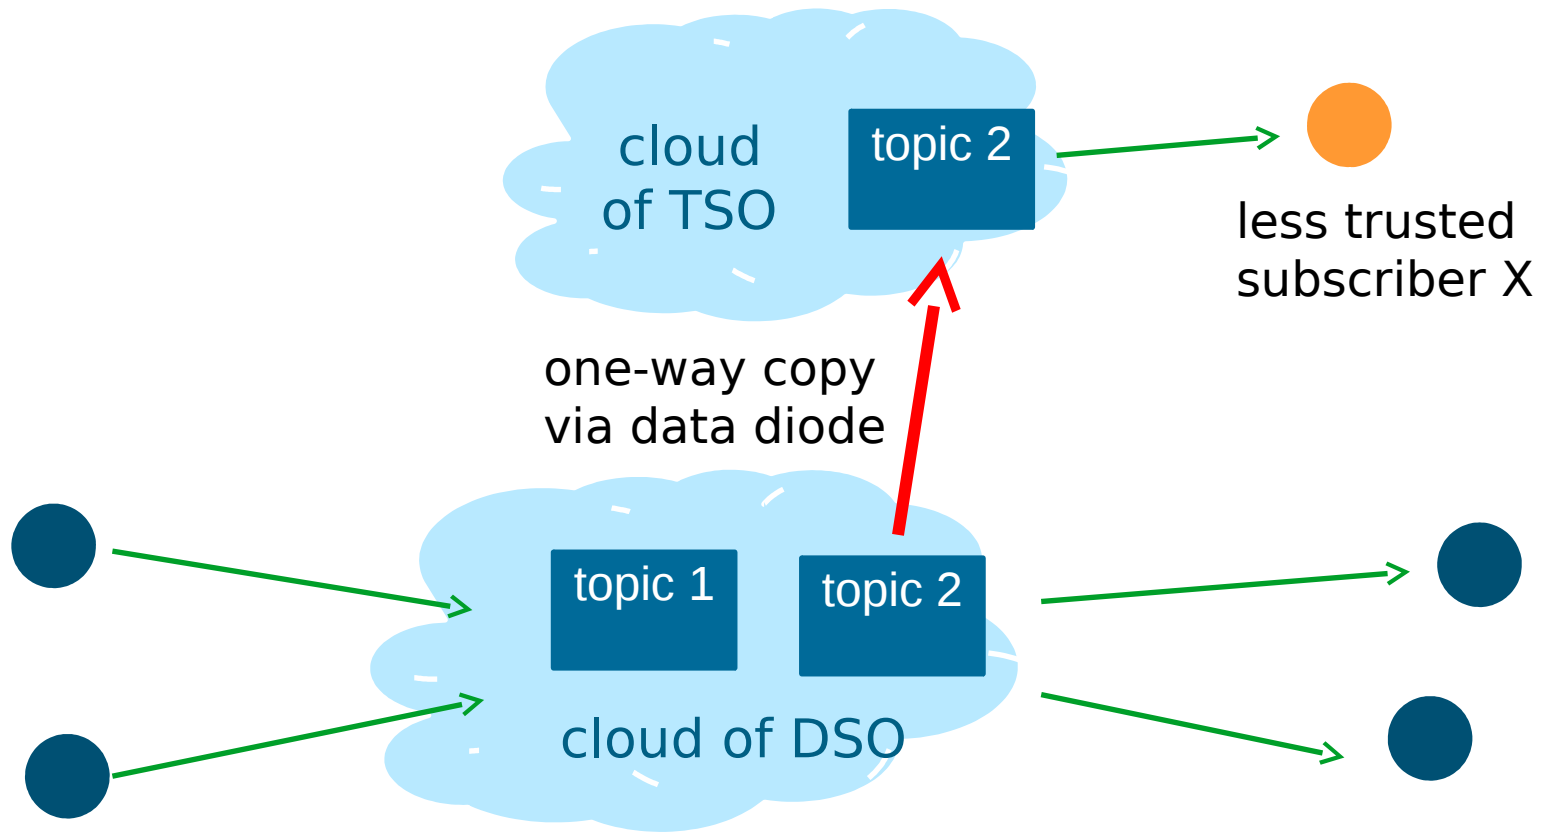

Securing Information Centric Networking (ICN)

Securing Inter Domain Communications

Securing Inter Domain Communications

Conclusions

- *Before* you start securing communications, think about the data & functionality you want to expose
- Standard solutions like TLS are for securing connections
 - but securing individual links might not provide the end-to-end security you want...
- Information-centric networking naturally provides end-to-end security
 - C-DAX network overlay can provide end-to-end security independent of underlying communication networks
- *After* you secure communications, you still want to secure the end points...
